A protecting group or protective group is introduced into a molecule by chemical modification of a functional group to obtain chemoselectivity in a subsequent chemical reaction. It plays an important role in multistep organic synthesis.. In many preparations of delicate organic compounds, some specific parts of their molecules cannot survive the required reagents or chemical environments.

The increased ratio of 4 to 3a at lower temperature and shorter residence time is consistent with formation of 4 as the initial product of the reaction (). N-methylaniline 3a could then be formed by an in situ thermal decarboxylation of 4, analogous to a solvent-free thermal tert-butyloxycarbonyl (Boc) deprotection. 14 Based on these observations, we propose that the reaction sequence begins ...
